1.8V-3.3V PicoPLL™ 32K Input, MHz Output Clock

FEATURES

- Advanced PLL design for low-frequency (KHz) input applications.
- Accepts ≥0.1V reference signal input voltage
- Very low Jitter and Phase Noise (30-70ps Pk-Pk typical)
- Input Frequency: 32.768kHz
- Output Frequency: 12MHz / 24MHz
- Single 1.8V ~ 3.3V, ± 10% power supply
- Operating temperature range from -40°C to 85°C
- Available in 6-pin DFN, SOT23, and SC70 GREEN/RoHS compliant packages.

DESCRIPTION

The PL611s-52 is a low-cost general purpose frequency synthesizer and a member of PhaseLink's PicoPLL™ family. Designed to fit in a small SOT23, SC70, or DFN package for high performance applications, the PL611s-52 accepts a low frequency 32.768kHz Reference input and generates a selectable 12MHz or 24MHz output with the best phase noise, jitter performance, and power consumption for handheld devices and notebook applications.

APPLICATION RECOMMENDATIONS FOR PL611s-52

PL611s-52 accepts a reference input of 32.768kHz and produces a 12MHz or 24MHz clock output as shown in diagram '1', below. However, to save costs in consumer product system designs and for greater area optimization, it is possible to use the XOUT of the RTC crystal (32.768KHz) as the reference input to the PL611s-52, as shown in diagram '2', below.

Note: An AC Coupling Cap may be required if RTC Clock amplitude is too small.

PCB LAYOUT CONSIDERATIONS FOR PERFORMANCE OPTIMIZATION

The following guidelines are to assist you with a performance optimized PCB design:

- Keep all the PCB traces to PL611s-52 as short as possible, as well as keeping all other traces as far away from it as possible.

- When a reference input clock is generated from a crystal (see diagram above), place the PL611s-52 'FIN' as close as possible to the 'Xout' crystal pin. This will reduce the cross-talk between the reference input and the other signals.

- Place the Loop Filter (LF) components as close to the package pin of PL611s-52 as possible.

- Place a 0.01µF~0.1µF decoupling capacitor between VDD and GND, on the component side of the PCB, close to the VDD pin. It is not recommended to place this component on the backside of the PCB. Going through vias will reduce the signal integrity, causing additional jitter and phase noise.

- It is highly recommended to keep the VDD and GND traces as short as possible.

- When connecting long traces (> 1 inch) to a CMOS output, it is important to design the traces as a transmission line or 'stripline', to avoid reflections or ringing. In this case, the CMOS output needs to be matched to the trace impedance. Usually 'striplines' are designed for 50Ω impedance and CMOS outputs usually have lower than 50Ω impedance so matching can be achieved by adding a resistor in series with the CMOS output pin to the 'stripline' trace.

GUIDELINES FOR EXTERNAL COMPONENT SELECTION

For the optimum performance, accurate external loop filter components must be selected. A general guideline for selecting these components based on the input frequency is shown in the below table.

Input Frequency	Capacitor Value	Resistor Value
32.768kHz	6.8nF	56KΩ

Exposure of the device under conditions beyond the limits specified by Maximum Ratings for extended periods may cause permanent damage to the device and affect product reliability. These conditions represent a stress rating only, and functional operations of the device at these or any other conditions above the operational limits noted in this specification is not implied. *Operating temperature is guaranteed by design. Parts are tested to commercial grade only.
